Re: Year 2009-2010 Annual Report
Beaufort County Storm Water Monitoring
Beaufort County, South Carolina

Dear Mr. Ahern:

Enclosed is the Year 2009-2010 Annual Report for the project, titled “Beaufort County Storm Water Monitoring, Beaufort County, South Carolina.” If I can answer any questions or provide you with additional information regarding this report, please contact me at (843) 769-7378.

Yours very truly,

Joseph E. Coffey, Jr., P.E.
Director

YEAR 2009-2010 REPORT

Beaufort County Storm Water Monitoring

Beaufort County, South Carolina

EXECUTIVE SUMMARY

The Beaufort County Water Quality Monitoring Program was developed to achieve the four primary goals identified in the Storm Water Management Plan (SWMP) and support the county's future implementation of this plan. The four primary goals are: 1) establish baseline water quality; 2) determine and track long-term trends to measure effectiveness of current best management practices (BMPs); 3) conduct bacterial source tracking and; 4) measure efficiency of selective BMPs. Table 1 shows the recommended tributary sampling as indicated in the SWMP. GEL Engineering, LLC (GEL) was selected by Beaufort County to implement the water quality monitoring program.

With regard to the Year 3 (2009-2010) sampling and analysis activities, adjustments were made to allow Beaufort County to more closely monitor fecal coliform levels in particularly sensitive areas. BST, also referred to as Microbial Source Tracking, or MST, was added and took place beginning in February 2009, and continued through March 2009. Due to the inconclusive nature of the data derived during the additional BST, it was determined that remaining funds that were to be utilized for the tracking of potential bacterial sources were best spent determining existing baseline water quality for future evaluation of BMP effectiveness.

Additionally, due to elevated concentrations of copper at Eagles Point, expanded copper evaluations began at the Eagles Point sample stations (BMP-Out and Pinckney Colony). Flow meters were also installed at these sample collection sites for the purpose of performing load calculations. Furthermore, based on the Eagles Point monitoring results and Beaufort County's desire to evaluate the performance/efficiency on an existing structural BMP (ex., a detention pond), the County intends to identify another BMP site to evaluate.

There are limited conclusions that can be drawn from the data collected thus far:

- A few of the sample collection sites remain under the influence of salt water due to tidal intrusion and should be relocated.
- Some sample collection sites have consistently demonstrated good water quality and Beaufort County elected to discontinue collecting data at these sites.

- Data collected since the onset of the County's monitoring program suggests that the data initially used by CDM to calibrate their storm water model is higher than the data collected from the present storm water monitoring program.

YEAR 2009-2010 REPORT

Beaufort County Storm Water Monitoring

Beaufort County, South Carolina

1.0 Year 3 Storm Water Monitoring

GEL was retained to continue the storm water monitoring program that was initiated in June 2007. During Year 3, GEL:

- Continued monitoring all established stations in response to a qualified storm event rather than on a set schedule;
- Reported sample values exceeding “action levels” to Beaufort County for those parameters with “critical exceedence concentrations”;
- Routinely met with Beaufort County to review the latest data, and;
- Made adjustments to sample locations, parameters measured, etc. based on the monitoring results, data review, and monitoring program directives supplied by Beaufort County.

Table 2 summarizes the stations monitored during Year 3 including their name, watershed, receiving water body and classification, etc., and most importantly their purpose.

1.1 Sample Locations and Purpose

Since initiation of the storm water monitoring program, the selection and identification of appropriate sampling sites for grab sampling and automatic storm event sampling has been based on the water quality sensitivity analysis (modeling), the current level of service for water quality segments, and the existing and future land use classifications. During Year 3, six trending sites were maintained, fourteen existing water quality stations were monitored, and additional data was collected to characterize the high and medium density residential runoff stations, as well as the addition of a station for copper evaluation. Note that two additional existing water quality sites were initiated in Year 3 (refer to Table 2), and their purpose will be further discussed in Section 2 of this report. All sites monitored during Year 3 are displayed on Figure 1.

1.2 Qualifying Storm Events

During Year 3, GEL collected grab samples and conducted field measurements at all stations following a storm event that was greater in magnitude than 0.1 inches in magnitude per hour and that occurred at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event.

GEL also conducted monthly composite storm event sampling at seven discrete auto sampler locations, provided that a storm event greater than 0.1 inches in magnitude per hour had not occurred within 72 hours from a previously measurable (greater than 0.1 inch rainfall) storm event. Samples were collected with an automatic sampler that was established and secured in each of the locations. The automatic sampler collected an aliquot every two minutes for the first 30 minutes following a qualifying storm event for a “grab sample,” and then collected a 15 minute aliquot for the next two and a half hours for a composite sample. Based on recommendations from the Year 2 Annual Report, the composite auto sample was no longer collected beginning in September 2009. Instead, a second grab sample was collected when GEL personnel collected the grab from the automatic sampler (referred to as “Grab After” in Tables 3 through 26).

1.3 Sampling/Analytical/QA-QC Procedures

All sampling events were conducted following GEL’s Standard Operating Procedures, United States Environmental Protection Agency (EPA) and SCDHEC approved sampling and analytical protocols, and appropriate safety measures. The table below identifies each parameter analyzed, the method allowable maximum holding time, sample preservative and the analytical method:

Parameter	Holding Time	Sample Preservative	Analytical Method
Fecal Coliform bacteria (FCB)*	24 Hours	Na ₂ S ₂ O ₃	EPA 200.8
Total suspended solids (TSS)	7 Days	4°C	EPA 160.2
Salinity	28 Days	4°C	EPA 120.1
Biochemical oxygen demand (BOD)	48 Hours	4°C	EPA 405.1
Ammonia nitrogen (NH ₃ -N)	28 Days	4°C, H ₂ SO ₄ (pH<2)	EPA 350.1

Nitrite and nitrate nitrogen ($\text{NO}_3 + \text{NO}_2$)	28 Days	4°C, H_2SO_4 (pH<2)	EPA 353.1
Total Kjeldahl nitrogen (TKN)	28 Days	4°C, H_2SO_4 (pH<2)	EPA 351.2
Total phosphorus (TP)	28 Days	4°C, H_2SO_4 (pH<2)	EPA 365.4
Chlorophyll-a (chl-a)	48 Hours	4°C	SM10200H
Total organic carbon (TOC) - quarterly	28 Days	4°C, H_2SO_4 (pH<2), zero headspace	EPA 415.1
Metals (cadmium, chromium, copper, iron, lead, manganese, mercury, nickel and zinc) — quarterly)	6 Months	4°C, HNO_3 (pH<2)	6010B

* GEL recommended that fecal coliform levels be analyzed using the five-tube dilution method (also known as MPN) since it provides more accurate results for samples containing turbidity and saltwater and is consistent with methods used during the previous monitoring events. Additionally, the standard holding time for fecal coliform is six hours; however, this method allows for a holding time of 24 hours if the sample data is not for potable water and will not be used for compliance purposes.

Analysis of pH, temperature, dissolved oxygen, turbidity and salinity was performed in the field using a calibrated Series 4a DataSonde, manufactured by Hydrolab. This allowed parameters with a short holding time to be analyzed in-situ at the time of sampling at each sample location, thus providing more accurate results. The results of the field analyses were stored in the Hydrolab and documented on Field Data Information Sheets. Ambient weather conditions noted during each monitoring event included precipitation over the previous 24 hours. In addition, tide levels were noted during the time of sampling at each location. Each of these field parameters was recorded on a Field Data Information Sheet.

While grab and composite samples collected using the auto samplers was described in Section 1.2 of this report, discrete grab samples were collected by lowering a new sampling container directly into the surface water and next transferred to the appropriate laboratory sample containers that have been pre-labeled and containing the appropriate sample preservative. Sampling personnel wore new laboratory-quality, PVC gloves during all sample collection activities, and changed gloves, at a minimum, between each monitoring location. Each sample container was identified with a laboratory label that was completed during collection, and each label included the following information:

- The address and telephone number of GEL;
- A specific client code for the County;

- The parameter to be analyzed from that container;
- The sample identification number/name, and;
- The date and time of sample collection.

A chain of custody form (COC) was completed and maintained throughout sampling and transportation to the laboratory. Samples were transported to GEL Laboratories, LLC, or the designated subcontracted laboratory for analysis. A sufficient amount of freezer packs and/or ice was maintained in the cooler to ensure that the samples remain at the recommended temperature (4° C). The analytical results were submitted to the County no more than 30 days from the date of sample collection. (The COC and analytical certificates were not submitted to the County and are not included within this report, but may be supplied upon request.)

1.4 Bacterial Source Tracking

During Year 3, BST was further investigated due to fecal coliform results in the May River area. The fecal coliform results revealed that water leaving developed areas contained low values of fecal coliform. However, after exiting the developed areas and traversing wetlands, high levels of fecal coliform were present in the water leaving the wetlands. Additional BST efforts were discussed to determine whether the increased fecal coliform was from new sources of contamination in the wetlands (i.e. wildlife) or from existing fecal coliform (i.e. re-growth in the environment) being washed out of the wetlands from increased stormwater flow.

Following conversations with the BST laboratory in Miami, Florida, (Source Molecular Corporation), and the Charleston, South Carolina Branch of the National Oceanic and Atmospheric Association (NOAA), it was determined that the current prevalent BST technologies would not produce results such that high confidence interpretations of data and recommendations could be made regarding the source of fecal coliform in the May River area. Therefore, the recommendation was made to keep controlling storm water volumes and, if necessary in the future, develop a management strategy for wildlife.

2.0 Adjustments Made During Year 3 Monitoring

Several adjustments were made during Year 3 of the storm water monitoring program. During Year 3, two new existing water quality stations were added (BECY-15 and BECY-16), two existing water quality stations were relocated (BECY-4R and Christine Place-R), a copper evaluation station was added (Pinckney Colony), and

sampling from three existing water quality stations was discontinued (BECY-6R, BECY-10, and BECY-11).

2.1 Monitoring Station Changes

During Year 3, two sample stations were relocated. Sample station BECY-4 was relocated due to high salinity. The site was relocated to BECY-4r and its purpose is to evaluate the existing water quality for the east fork of the Okatie River headwaters. Additionally, the existing water quality sample station located at Christine Place was relocated due to concerns that water input from surrounding woodlands was contributing to discharge from the stormwater pond from which samples were collected. The sample site was relocated to Christine Place-R and collected as water directly exited the pond into a drainage ditch. Additionally, the automatic sampler from the site was removed and samples from Christine Place-R are collected as a grab-only station.

In September 2009, sample station Pinckney Colony was added to the sampling efforts. Samples collected from this station are for the purposes of monthly copper evaluation, which is the only analyzed parameter. In conjunction with copper results from BMP-Out, results from the Pinckney Colony station will be used to determine the concentration and potential toxicity of copper exiting the Eagles Point Golf Club.

In February 2010, sample station BECY-15 was added as an existing water quality station. The sample is collected from water exiting an area in which the Beaufort Marine Corps Air Station is completing a wetlands mitigation project. The results from the sampling will be used to evaluate the effects the project has on water quality. In May 2010, sample station BECY-16 was added as an existing water quality station. BECY-16 is used to evaluate the existing water quality of the western fork of the Okatie River headwaters for the purpose of locating a Water Quality Retrofit in the area.

In February 2010, sample efforts at the existing water quality stations BECY-6r, BECY-10, and BECY-11 were discontinued. Sample collection ceased as these stations due to the collection of two years of low-variability data.

2.2 Eagles Point Copper Evaluation

During Year 3, review of quarterly total copper data for sample station BMP-Out revealed copper concentrations exceeding current regulatory standards. Current regulatory standards range from 3.0 to 6.0 micrograms per liter ($\mu\text{g}/\text{L}$). In one instance, results from the total copper quarterly sampling produced results exceeding 130 $\mu\text{g}/\text{L}$.

The analysis of these samples was for total copper, all of which is not biologically available in aquatic systems.

An analysis for dissolved copper could provide more insight into the potential toxicity within the ecosystem, since dissolved copper tends to be more biologically available. It is important to note that not all dissolved copper is biologically available, but if dissolved copper concentrations were less than the regulatory standards, the measured copper should not be toxic to aquatic organisms. Therefore, in September 2009, monthly sampling at BMP-Out and Pinckney Colony began for both total and dissolved copper to determine if dissolved copper concentrations are greater than existing regulatory standards. Following several months of sampling, the dissolved copper concentrations were greater than the regulatory standards.

Following these results, a sediment sample was collected from the pond basin adjacent to the BMP-Out outfall. These results were used to determine if the sediments in the storm water ponds is a source of copper, which could be washed out during rain events. Based on NOAA Reference Tables for Sediments, the results of the sediment sample analysis indicated that copper concentrations were consistent with background concentrations. Therefore, it was determined that the sediments were not a significant source of the copper concentrations being detected in the BMP-Out samples.

Although the total and dissolved concentrations were greater than the regulatory standards, a large unknown was whether the observed concentrations would be toxic within this aquatic ecosystem. Therefore, with the recommendation of a Beaufort County Stormwater Utility Management Board member, GEL would complete a Biotic Ligand Model (BLM) analysis, consisting of 3 different sampling events. The BLM predicts the metal toxicity and speciation for a particular site based on the ambient water quality. Therefore, by inputting temperature, pH, dissolved organic carbon, cations, anions, alkalinity, and sulfide, the BLM would predict whether measured concentrations of dissolved copper would be toxic in the aquatic ecosystem.

During Year 3, one of the three data sets was collected. The BLM revealed that the observed concentrations of dissolved copper were below the predicted levels of copper toxicity in the aquatic system. However, the remaining two datasets could not be collected in Year 3 due to high water temperatures, for which the BML is not calibrated. The model is only calibrated for water temperature values ranging from 10°C to 25 °C. The remaining two datasets will be collected in Year 4.

2.3 Eagles Point Flow Meters

During Year 3, flow-meters were installed at the two Eagles Pointe outfall points – BMP-Out and Pinckney Colony. The Greyline Instruments, Level-Volocity *Stingray* Logger flow-meters continuously measures and stores water temperature, depth, and velocity data at programmed intervals. Using this data and information about the outfall pipe (i.e. pipe diameter) flow estimates from the system can be calculated. GEL routinely downloads and processes this data and provides the information to Mr. Rick Karkowski of Thomas and Hutton. Mr. Karkowski utilizes this data to perform loading predictions from Eagles Pointe.

3.0 Year 3 Data Analysis

As indicated, GEL's monitoring is being performed to achieve four primary goals identified in the SWMP and support the county's future implementation of this plan. The primary goals are:

1. Perform long-term trend analysis to track BMP effectiveness;
2. Evaluate baseline existing water quality;
3. Confirm model inputs for select structural BMPs; and,
4. Confirm model inputs for runoff quality from land use areas.

3.1 Baseline Existing Water Quality

Stations with higher salinity values indicate the collection of tidally influenced samples rather than those of storm water resulting from a wet weather event. Stations BECY-5 (existing WQ), and BECY-14 (trending) indicate significant salinity. In addition, BECY-2 and BECY-3 indicate elevated salinity values. As a note, due to the elevated salinity concentrations at BECY-5, samples will no longer be collected at this sample station in Year 4.

As indicated, stations with results above the applicable water quality standards should receive a higher priority for implementing future BMPs. Note that all stations have average fecal coliform concentrations greater than the state standard of 14 CFU/100 ml. Based on Year 1-2 results, BECY-4 had an elevated percentage of sample results above the water quality standards for parameters. However, BECY-4 has been relocated to BECY-4R and further sample collection will be required to determine if the new sample location consistently has elevated results for the water quality parameters. Existing WQ stations Southside, BECY-12 and BECY-7ra are also above the average with regard to water quality exceedances.

4.0 Year 3 Conclusions

GEL was retained to continue the storm water quality monitoring during year 2009-2010, while integrating improvements over the existing sampling and analysis program. With GEL and Beaufort County's coordinated efforts, the Year 2009-2010 storm water sampling and analysis was revised to incorporate lessons learned during the previous year. During year 2009-2010, GEL and Beaufort County discontinued the BST efforts with regard to fecal coliform contamination on the May River. This decision was based on limitations with the current BST technologies. In addition to summarizing the Year 2009-2010 storm water monitoring program within this annual report, and, as requested by the Beaufort County Storm Water Utility Board, GEL has listed observations made during year 2009-2010 which we believe are worthy of further consideration with regard to changes in future storm water quality monitoring in Beaufort County:

- Relocating BECY-5 and BECY-14. It is recommended that Beaufort County relocate the two sampling locations due to interference from salt water intrusion. If unable to be relocated, the sample locations should be eliminated since the data collected is not likely storm water runoff. BECY-2 and BECY-3 have demonstrated elevated salinity levels, but not as significant as BECY-5 and BECY-14.
- Southside, BECY-7ra and BECY-12 may be good water quality monitoring sites for implementing future upstream BMPs. As noted above, these sites should not be influenced by salinity and should be true storm water derived samples. However, they have more results above the state water quality standards than other stations.
- Locating a new BMP efficiency site. Presently there is no BMP site identified for the Beaufort County water quality monitoring program.
- Moving runoff sites (BECY-1A and BECY-4A) to new high/medium density residential or industrial/heavy commercial sites. Since the data collected from these existing sampling sites is considerably lower than the data originally used by CDM to calibrate the water quality model, it may be advisable to collect data from other sites to determine how it compares with the model data.

BECY-4 relocated in September 2009

Christine Place was relocated in September 2009 and changed to a grab-only sampling station

Beginning October 2009 - Composite sample from Auto Samplers are no longer collected. Instead, a grab sample is collected within 24-hours of rainfall.

BECY-6r, 10, & 11 - No Longer Sampled after February 2010

Results reported in mg/L

BECY-4 relocated in September 2009

Christine Place was relocated in September 2009 and changed to a grab-only sampling station

Beginning October 2009 - Composite sample from Auto Samplers are no longer collected. Instead, a grab sample is collected within 24-hours of rainfall.

BECY-6r, 10, & 11 - No Longer Sampled after February 2010

Results reported in µg/L

*Fecal Coliform is internally tracked for Critical Exceedance Concentration information.

BECY-4 relocated in September 2009

Christine Place was relocated in September 2009 and changed to a grab-only sampling station

Beginning October 2009 - Composite sample from Auto Samplers are no longer collected. Instead, a grab sample is collected within 24-hours of rainfall.

BECY-6r, 10, & 11 - No Longer Sampled after February 2010

Results reported in Colony Forming Units (CFU)/100 mL

BECY-4 relocated in September 2009

Christine Place was relocated in September 2009 and changed to a grab-only sampling station

Beginning October 2009 - Composite sample from Auto Samplers are no longer collected. Instead, a grab sample is collected within 24-hours of rainfall.

BECY-6r, 10, & 11 - No Longer Sampled after February 2010

Results reported in mg/L

BECY-4 relocated in September 2009

Christine Place was relocated in September 2009 and changed to a grab-only sampling station

Beginning October 2009 - Composite sample from Auto Samplers are no longer collected. Instead, a grab sample is collected within 24-hours of rainfall.

BECY-6r, 10, & 11 - No Longer Sampled after February 2010

Results reported in parts per thousand

BECY-4 relocated in September 2009

Christine Place was relocated in September 2009 and changed to a grab-only sampling station

Beginning October 2009 - Composite sample from Auto Samplers are no longer collected. Instead, a grab sample is collected within 24-hours of rainfall.

BECY-6r, 10, & 11 - No Longer Sampled after February 2010

Results reported in mg/L
